

5 Best Practices For Data Centre Security

01

ADDRESS YOUR CURRENT & FUTURE ENVIRONMENT

It is critical to address every corner of modern data center which ever tool or process is being deployed. This includes anything you may add or develop in the future as well.

Look for something that has vulnerability management, file integration management and other software hardening configuration management.

02

HARDEN YOUR SYSTEMS

03

SEGMENT YOUR NETWORK

Push towards ever smaller segments that divide up you data center into defined and protected sections. Contain cyber threat from spreading through your ecosystem.

Data centers are dynamic and applications change rapidly. Any security process which is not automated will eventually become outdated and irrelevant.

04

AUTOMATE EVERYTHING

05

DEPLOY EFFECTIVE DETECTION

Reduce complexity as much as possible by focusing on lateral movement detection and converged tools.
